Gulf Star projects are only made possible by the shared vision of our partners: Shell Exploration & Production, The Nature Conservancy, Freeport McMoRan, Inc., Anadarko, BHP, Hess Petroleum, National Oceanic and Atmospheric Administration, and U.S. Fish and Wildlife Service. Their recognition that regional collaboration is essential to project success is what makes this program work.

Message From Our Executive Director

Gulf Star projects are only made possible by the shared vision of our partners: Shell Exploration & Production, The Nature Conservancy, Freeport McMoRan, Inc., Anadarko, BHP, Hess Petroleum, National Oceanic and Atmospheric Administration, and U.S. Fish and Wildlife Service. Their recognition that regional collaboration is essential to project success is what makes this program work.
Gulf Star Partner

“BHP is committed to working with communities to develop strategies to combat environmental challenges. GOMA’s Gulf Star program fits with our overall approach of being an active partner to help communities respond to risks in a sustainable way.”

SARAH DANIEL, BHP

Gulf Star Grant Recipient

“Through the Gulf of Mexico Alliance small grant program, the City was able to identify options that reduced vulnerability with comparable construction costs, reduced maintenance costs, and improved aesthetics for Inner Harbor Park. It is imperative that we keep this conversation going for the health and resiliency of our Gulf Coast.”

CAROLYN MARTIN, CITY OF OCEAN SPRINGS

Gulf Star Partner

“Participating in the Gulf Star program is a great way to make sure that our Federal dollars go further, making impacts beyond what we can do alone. It’s a great example of a public-private partnership and how we can work regionally with private industry, states, and others to have collective impact on shared needs.”

Investing in Resilience for the Florida Keys

The South Florida Regional Planning Council recently completed a project in the Florida Keys, focused on the village of Islamorada. Planners mapped storm surge for a Category 1 hurricane now, and in the future, when sea levels will be higher. “By knowing the risks, we know where to target resilience efforts,” said Regional Planner Alyssa Wood. Using new data allows for more localized recommendations and results from the project can help the community update evacuation zones, building codes, and comprehensive plans. Understanding key assets at risk to flooding now and in the future is a valuable investment, as noted by Patxi Pastor, Founder and CEO of the Celebrations of the Sea Foundation, “$1 in mitigation or planning can save $4-6 on the recovery side.”

16 Restaurants Reducing Single-Use Plastic

Increased Time That Shellfish Beds Are Open
Plastic Free Gulf Coast is eliminating single-use plastics, such as straws and utensils, through education and incentives to local businesses. The project has two main goals: 1) empowering businesses and customers to make an immediate positive impact on the environment and 2) building a local green economy around quality, eco-conscious products. Because 80% of marine debris is plastic and 50% of that is single-use disposable items like straws, “skipping the plastic” can have an immediate impact on reducing pollution. So far, 16 restaurants in three states are participating in Plastic Free Gulf Coast and additional businesses are interested in joining.

“We were going through 4,000 plastic straws per week... most were being used in the restaurant and then thrown away. This is something we’ve wanted to do for a long time... and it’s much cheaper than the traditional products we were using.”

27 Threatened & Endangered Wildlife Species

Improving Recovery for
24 New Water Sampling Sites
Across the Gulf of Mexico, two projects are providing important information to enhance the success of living shorelines. These structures control erosion using natural materials, including marsh plants and oysters, and protect coastal property while enhancing habitat. Living shorelines are more resilient than traditional bulkheads, provide protection from storms, filter pollution, and create homes for fish and wildlife.

One project spans the entire region, identifying existing shoreline data needed for the construction of living shorelines and current gaps in coverage. The second project focuses on Tampa Bay, where multiple threats have put a spotlight on the importance of coastal protection. Researchers modeled shorelines and identified only small portions of the bay that should be protected using current practices of hardened revetments or bulkheads. Nearly 90% of the bay would benefit from installing living shorelines or protecting and enhancing natural marshes and mangroves. Project maps are available online and results have been shared with homeowners, private businesses, and natural resource managers to help them make better decisions.
